SUMMARY

Python backend developer. I build REST APIs and event-driven systems in **FastAPI** and **Django/DRF** with Clean Architecture, DDD and TDD: **700+ tests** across three projects, integration tests against real PostgreSQL in CI and decisions recorded in ADRs. I develop with AI coding agents (Claude Code, OpenCode) every day and merge each change only when CI is green.

PROJECTS

Independent development · Apr 2025 – present

Event-Driven Orders · E-commerce orders with microservices and RabbitMQ — Repo

`3 microservices · 138 tests + e2e · 85–92% coverage per service · 19 ADRs`

- **Idempotent consumers**: a redelivered event never duplicates effects (`INSERT … ON CONFLICT DO NOTHING`).
- **Race-free stock reservation** (conditional UPDATE + row-level locking), tested against real PostgreSQL.
- **DLQ and retries with backoff** in 3 stages (transient vs. permanent failures); eventual consistency through choreography.
- **Observability**: JSON logs with an end-to-end correlation ID (HTTP → events → 3 services).

MedBook API · Medical appointment booking with Django + DRF — Repo · Swagger (first load ~50 s)

`305 tests · 99.4% branch coverage · TDD`

Doctors publish schedules, patients book them and each appointment follows a state machine.

- **RBAC** with 8 permission classes and object-level access control (doctor / patient / admin).
- **Safe concurrent booking** (transaction + atomic UPDATE), backed by a test where two threads race for one slot.
- No N+1 queries (`select_related` / `prefetch_related`), OpenAPI 3 with Swagger and login rate limiting.
- **TDD** (Red-Green-Refactor); CI runs lint, tests against real PostgreSQL and a 95% coverage gate.

Monolith API · Modular monolith with FastAPI — Repo · Swagger (first load ~50 s) · Frontend

`263 tests · 85% branch-coverage gate · deployed on Render`

REST API with Clean Architecture and DDD across three modules (auth, users, todos) and its own React + TS frontend.

- **Full auth**: refresh-token rotation with reuse detection, Google SSO, OTPs, Argon2 and rate limiting.
- Framework-free domain; modules talk through ports (`UserProvider`) rather than shared models.
- Tests against real PostgreSQL plus an `alembic check` gate in CI that catches schema drift.

EXPERIENCE

IT Support Analyst · Dominó (Cadaques) — Santiago, Chile · Apr 2023 – Jul 2024

- Built a **Python (pandas) ETL on SQL Server** that turned **millions of sales receipts** from every branch (text and XML files, 2022–2023) into data used by finance, accounting and marketing for KPIs and product analysis.
- **Automated sending receipts to the e-invoicing provider**.
- Resolved production incidents down to their root cause, maintained SQL databases and automated tasks with Python.

TECHNICAL SKILLS

Languages	Python, SQL, TypeScript
Backend	FastAPI, Django, Django REST Framework, Pydantic v2, SQLAlchemy 2.0, Alembic, JWT, OAuth2
Data	PostgreSQL, SQL Server, pandas, RabbitMQ (aio-pika), Supabase
Architecture	Clean Architecture, DDD, modular monolith, event-driven microservices, ADRs
Testing	pytest, TDD, testcontainers, factory-boy, branch coverage
DevOps	Git, Docker, Docker Compose, GitHub Actions, Render, Vercel, structlog (JSON logs)
Applied AI	Claude Code (skills, subagents, hooks), OpenCode, Spec-Driven Development

LANGUAGES

Spanish: Native
English: C2 in reading and listening
(EF SET 71/100) · B2+ speaking

EDUCATION

Programmer Analyst (Analista Programador) · Graduated
Instituto Profesional Santo Tomás · Santiago, Chile · Mar 2021 – Jul 2025
